(54) Title: FORMULATIONS FOR TREATMENT OF PAIN COMPRISING VITAMIN B12 AND PHENYLANINE

(57) Abstract

Orally administrable formulations containing a vitamin B_{12} component, preferably hydroxocobalamin, and phenylalanine are described. They may be taken at a specified daily dosage to provide 50 to 5000 mg phenylalanine per day and 0.2 to 50 mg of vitamin B_{12} component. They are used to treat pain or chronic fatigue syndrome. Other drugs or essentiel nutrients may be added such as folic acid, glucosamine or an anti-depressant drug as appropriate.

FORMULATIONS FOR TREATMENT OF PAIN COMPRISING VITAMIN B12 AND PHENYLANINE

Pain is a major human problem. It comes in many different forms, such as the pain of an acute injury or surgical procedure, the pain associated with chronic inflammation, for example of the joints, the pain of headaches, including migraine attacks, the pain associated with muscle spasms, and many types of long term, chronic, ill-defined pain. Chronic long-term pain is often associated with nerve damage of one type or another. The nerve damage may result from a medical illness such as diabetes or alcoholism, or from damage to nerves resulting from local physical pressure or injury such as many forms of back pain and lower limb pain, or pain resulting from severance of a nerve with partial regrowth, or pain with no very obvious cause such as fibrositis or fibromyalgia.

Many types of drugs may relieve pain. Currently they fall into six major categories although, as pain mechanisms become better understood, more categories are likely to be discovered. These major categories are the opiates such as morphine, heroin, pethidine, codeine and related compounds; the steroids which work by reducing inflammation; the

non-steroidal anti-inflammatory drugs which inhibit the enzymes cyclo-oxygenase 1, cyclo-oxygenase 2 or both; a group of miscellaneous compounds which sometimes work in the pain associated with nerve damage (neuropathic pain) and whose most important members are the tricyclic antidepressants; anti-migraine agents which often interact with the serotonin system; and a group of compounds which are antagonists of various peptides which are believed to be involved in the production of pain. International publication WO 98/01157 discloses that, in the pain associated with diabetes, the antidepressant lofepramine may be particularly effective, especially when combined with the co-administration of neurotransmitter precursors such as L-phenylalanine and tryptophan and with vitamin B_{12}. Under certain circumstances it was stated that the combination of vitamin B_{12} with one of the neurotransmitter precursors might be beneficial but there is no disclosure of any particular treatment regimes.

We have now surprisingly found that two of the compounds described in the previous application, vitamin B_{12} and phenylalanine, are unexpectedly effective when presented orally in particular ratios and when the vitamin B_{12} is given in a high absolute dose and in a relatively high ratio to phenylalanine as compared to normal therapeutic doses of vitamin B_{12}. We have also found that this oral combination is effective not just in the pain of diabetic neuropathy but in all forms of chronic neuropathy, in pain associated with the spinal column, including low back pain and sciatica, in pain of unknown origin such as trigeminal neuralgia, and in headaches of many different types, including tension headaches and migraines. In addition to pain we have also found it beneficial in chronic fatigue syndromes. Over 80 patients with these various types of pain have been treated with good to

excellent relief in about three quarters. The relief usually begins within 24 to 72 hours of the first dose, sometimes within 6 hours, and then may show further improvement over one to two weeks. The improvement is then maintained indefinitely. Chronic fatigue usually takes about one week to improve initially and then shows further improvement over several weeks or months. In contrast to all other approaches to relieving pain, administration of formulations according to the present invention does not appear to be associated with any significant adverse effects.

Thus in accordance with a first feature of the present invention there is provided an orally administrable formulation containing a vitamin B_{12} component and phenylalanine, in a weight ratio of 1/100 to 1/1000, and wherein the concentrations of each are such as to provide, in a daily specified dosage of the formulation, from 50.0 mg to 5000.0 mg phenylalanine and from 0.2 mg to 50.0 mg vitamin B_{12} component.

The total daily dose of the phenylalanine component may be anything from 50mg to 5000mg, but is preferably from 200mg to 2000mg. The phenylalanine should usually be in the L- or DL-forms. However, recent findings of racemase enzymes in humans which can interconvert D and L amino acids mean that the D-form can also be effective. The total daily dose of the vitamin B_{12} component may be from 0.2mg to 50mg but is preferably from 0.5mg to 5mg. These doses are much higher than oral doses normally used in treating vitamin B_{12} deficiency states. The vitamin B_{12} may be in the form of hydroxocobalamin or cyanocobalamin: however, hydroxocobalamin is the preferred form. This is because hydroxocobalamin is a cyanide antagonist whereas cyanocobalamin is not. Since some forms of nerve damage may be related to cyanide accumulation either because of exposure to toxic cyanide-generating materials or to

nutritional deficiency states when cyanide may accumulate, or to errors of metabolism which may lead to elevated cyanide levels, it is preferable to use hydroxocobalamin as the source of vitamin B_{12}.

Surprisingly, no oral pharmaceutical products containing hydroxocobalamin are presently available. All currently contain cyanocobalamin. The materials may be formulated together in any appropriate dosage form known to those skilled in the art. Appropriate dosage forms include tablets, hard or soft gelatin capsules, powders, micro-encapsulated products, solutions, syrups, emulsions, mousses, gels, or other oral forms known to those skilled in the art. The daily dose may be taken at one time, or divided, for example into two, three or four portions.

The formulations may also contain other drugs or nutrients provided that the ratios of vitamin B_{12} component to phenylalanine, and the total doses of vitamin B_{12} component and phenylalanine are as claimed. An additional ingredient of particular value is glucosamine or glucosamine derivatives when the formulation is used to relieve the pain of arthritis. The vitamin B_{12} and phenylalanine act rapidly to relieve the pain whereas the glucosamine helps to provide long term repair of the damaged joints. Folic acid is another ingredient of particular value since it acts synergistically with vitamin B_{12} in several metabolic pathways. When folic acid is included, the ratio of vitamin B_{12} to folic acid should be between 1:4 and 4:1. Since chronic pain is often a feature of depression, an antidepressant drug of any appropriate type may also be added to the formulation in an appropriate dose.

EXAMPLES

1. Tablets containing 200mg L-phenylalanine with

between 2mg and 0.2mg of vitamin B_{12}, either as cyanocobalamin or hydroxocobalamin.

2. Tablets as in 1 but containing 500mg or 1000mg of L-phenylalanine in a ratio to the vitamin B_{12} component of 1/100 to 1/1000.

3-4. Formulations as in 1 and 2 but using hard or soft gelatin capsules

5. A syrup containing 500mg L-phenylalanine and between 5 and 0.5mg of vitamin B_{12} component in 10ml, together with appropriate flavouring.

6-10. Formulations as in 1-4 but in which the L-phenylalanine is replaced by DL-phenyalanine or D-phenylalanine.

11-15. Formulations as in 1-4 in which in addition there is included 100-500mg of glucosamine in an appropriate form as an anti-arthritic agent.

16-20. Formulations as in 1-4 in which other essential nutrients are included, particularly folic acid in a 1:1 ratio with vitamin B_{12}.

21-24. Formulations as in 1-4 in which an antidepressant drug of any type is added in an appropriate dose.

CLAIMS

1. An orally administrable formulation containing a vitamin B_{12} component and phenylalanine, in a weight ratio of 1/100 to 1/1000, and wherein the concentrations of each are such as to provide, in a daily specified dosage of the formulation, from 50.0 mg to 5000.0 mg phenylalanine and from 0.2 mg to 50.0 mg vitamin B_{12} component

2. A formulation according to Claim 1 wherein the vitamin B_{12} component is hydroxocobalamin.

3. A formulation according to Claim 1 wherein the phenylalanine is L-phenylalanine.

4. A formulation according to Claims 1, 2 or 3 wherein the phenylalanine is DL-phenylalanine, or D-phenylalanine.

5. A formulation according to any one of Claims 1 to 4 wherein the daily specified dosage of the formulation contains 200.0 mg to 2000.0 mg phenylalanine.

6. A formulation according to any one of Claims 1 to 5 wherein the daily specified dosage of the formulation contains 0.5 mg to 5.0 mg of the vitamin B_{12} component.

7. A formulation according to any one of the preceding Claims and additionally containing one or more essential nutrients or drugs.

8. A formulation according to any one of the preceding Claims and additionally containing glucosamine or one or more glucosamine derivatives.

9. A formulation according to any one of the preceding

Claims and additionally containing folic acid or related bioactive derivative.

10. A formulation according to any one of the preceding Claims and additionally containing an anti-depressant drug.

11. A method of treatment of pain or chronic fatigue syndrome which comprises the oral administration of a formulation in accordance of any one of the preceding Claims.

12. A method according to Claim 11 wherein the pain is diabetic pain due to peripheral nerve damage.

13. A method according to Claim 11 wherein the pain is a chest, abdominal, limb, pelvic, back or other pain originating from the spinal column.

14. A method according to Claim 11 wherein the pain is a headache or migraine headache.
